

Renewed Fresh Water and Drain Point

This well known product from our range , the Comfort Fresh Water and Drain Point, has been completely restyled and improved since last season. The pillar is wider, longer and more sturdy. The PE wall is thicker, making the construction stronger and more efficient.

The pillar can be fitted either with 1 or 2 CEE sockets, whereby the switch is located in a junction box near to the terminal. The switches and the kWh-metres may also be installed in the pillar if so wished.

This is no nonsense pillar offering practicality for you and your guests .

New collection drain:

The new collection drain is once again manufactured in one piece but has now double walls by means of rotational casting . The walls are thicker than the previous model, which in combination with the double walls provides enormous strength and a high level of dimensional stability.

Therefore it was possible to fit a drain connection 110mm directly to the main drain, no odour guaranteed ! In total there are only 2 components to install and fit. The drain is fitted with 2 cams which can be adjusted as desired for a permanent outlet for the waste water hoses from the caravans.

The double walled system allows the drains to be connected internally to the integrated syphon with the drainage connection. Special PE pipe bends fitted with caps are mounted in the cams using stainless steel chains so they are not lost.
