

## Outdoor lighting

Lighting is in many ways an important factor for your site. It creates atmosphere, visibility and security. Consequently, for many lighting situations specific technical advice is necessary, with matching fixtures, light sources (lamps) and masts.

We would advise in most cases to use energy efficient fixtures for a relatively low light output, but of course there are certain locations and situations that require more light intensity.

This is also possible in combination with energy efficient bulbs. The height of the mast is also significant to light intensity and distribution.

Light masts of 3 metres are commonly used in recreational facilities but higher masts are also possible.

We would be happy to advise you in these matters and can give any prices and details necessary.
