

Leisure Technics Registration Plate Recognition System.

Our Registration Plate Recognition system is specifically developed for parking facilities. At the entrance point the details are compared to a database containing details of vehicles with access to the site. After positive recognition, the system will activate the Multi-Bollard or barrier. This system may also be integrated if so wished. Registration Plate Recognition offers several advantages as opposed to the familiar card system.

- A registration plate does not break or damage easily and will not get lost.
- Cards are easily lost or damaged which means that cost of replacing the cards will be saved.
- A registration plate can not be lent to others to gain free access to the parking facilities which reduces loss of income.
- Only one registered vehicle has access per registration so it is impossible for a second vehicle to be given access using the same registration plate.
- Detailed management information can be used to plan occupancy levels and times. This enables you to increase usage by targeting new markets for low level occupancy times.
- The driver does not need to open his window to scan his card using this system, thus offering a higher level of service and comfort.
- You are able to generate a report of the amount of occupancy hours per registration plate which enables weekly or monthly detailed invoicing to the customer.

Extra possibilities as a result of damage or vandalism.

Details of occupancy and photographic evidence can assist the police in their enquiries in cases of damage or vandalism.

The benefits of the registration plate recognition system

A vehicle is used in nearly all criminal activities and tracing the registration is the first step in solving a crime. By comparing the registrations to the database, warnings can be generated allowing faster intervention.

Suitable areas:

- Unattended Areas
- Car Parks
- Industrial Estates
- Hotels, Camping Sites and Marinas
- Government Buildings
